1 Updates

- haskell-mode ready for use.
- org-mode minted works with pygments to get syntax highlight for source codes, including chinese characters comments.
- Screenshot works.
- Rebounded emacs keys for convenience for alt, commands.
- keybounded "Command-" for both mac and emacs for wubi input so I don't have to rethink whenever I need switch (and the key bounds are easy to use).
- babel org-mode so I don't have to copy from specific babeled source org-mode files in order for chinese characters to work.
- company-mode needs more work to improve efficiency.
- As I am getting more and more modes in init file, will need to initialize emacs according to modes pretty soon. Will find a good time to work on this one when tetris 3d is done.
-
- gets csharp-mode {} works for String s = "{}", works for int [] a = {*cursor_*} together with autopair global mode; but not for scope yet public void foo() {*cursor_*}.

2 TODOs

- configure and organize emacs better so that it won't take too much time when initializing.
